

## Tour Report Poland – Butterflies & Moths of Southern Poland

14-22 July 2019

*Araschnia levana*

*Plebejus argus*

*Zygaena minos*

*Lycaena helle*

Compiled by: Andrzej Petryna

Tour Leader: Andrzej Petryna with 5 participants

**Day 1: Arrive Krakow; drive to Szarów**

**Sunday 14 July 2019**

*Weather: sunny in early afternoon; heavy storm later. Continuous rain for the rest of the day. Temperature from 20°C/15°C in the storm*

After collecting all the participants and leaving the airport, we headed to the nearest part of the Jurassic hills just outside Kraków, to make the most of the daylight and to visit a few interesting sites before arriving at the hotel. We stopped at a large area of wet meadows with numerous butterfly host plants. Even though our walk was soon interrupted by a thunderstorm, we still managed to spot some interesting butterflies, including violet copper, scarce large blue and dusky large blue.

The rain did not stop and the weather forecast for the rest of the day was unfavourable so we finished our walk and drove straight to our hotel in Szarów near Niepołomice, postponing our visit for a more convenient time and better conditions.

After dinner, we discussed our plans for the coming days, with the hope that the weather would improve.

**Day 2: Jurassic hills – north-west from Krakow**

**Monday 15 July 2019**

*Weather: sunny; 23°C; cloudy in the afternoon*

Today we explored another scenic part of the Jurassic hills, located north-east from Kraków, with xerothermic slopes, limestone rocks and deep gorges with small streams. At first we visited some limestone xerotherms, with typical plants including thymus sp., coronilla sp., *anthericum ramosum*, *inula ensifolia*, *salvia verticillata*, *salvia pratensis*, and *melampyrum arvense*. While there, we observed numerous butterflies: swallowtails, map butterfly, marbled white, ilex, blue-spot and white-spot hairstreaks, sooty and scarce coppers, short-tailed, Adonis and chalk-hill blues. We also noticed a lot of crab spiders, *misumena vatia*, preying on different butterflies and bees. In the gorge following the small stream between the rock walls, we found numerous silver-washed fritillary, the summer version of map butterfly, rare coppers seen before at the slopes, and two interesting parasitic wasps – *ammophila sabulosa* and *gasteruption jaculator*.

In the afternoon we went back to the wet meadows we visited the day before. This time we were more fortunate with sunshine, and we enjoyed good sightings of violet copper, dusky large blue, short-tailed blue and scarce swallowtail.

**Day 3: Drive to Kielce Upland**

**Tuesday 16 July 2019**

*Weather: sunny, with some cloud, 18-20°C; wind medium to strong*

Today we transferred north-east, to the Kielce Upland and Pińczów region. The area is characterised by numerous crystalized gypsum layers, forming elongated ribs with xerothermic vegetation, such as, *onobrychis* sp., *scabiosa* sp., *eryngium campestre*, *linum chirsutum*, *carlina onopordifolia*, *vincetoxicum officinale* and *stipa capillata*. During our drive we stopped at one of these sites, where we spotted Ripart's anomalous, eastern baton, Reverdin's, Chapman's and turquoise blues, eastern Bath white, pale clouded yellow and great green bush cricket, as well as some zygaenas. As a next stop we visited some meadows at the river Nida, with plenty more common butterflies and white-legged damselflies. It was impossible not to pay attention to the local avifauna, so we also watched marsh harriers and a red-backed shrike male feeding his chicks with great green bush cricket prey. Later in the afternoon we reached our hotel in a small park at the bank of the Nida River, where over dinner we discussed our plans for the next day in Kielce Upland.

**Day 4: Kielce Upland****Wednesday 17 July 2019***Weather: cloudy; 20-23°C*

As a result of our evening discussion, we spent the day exploring two interesting sites: the forest glade in one of the local nature reserves, and a chalk hill with the old limestone quarry. The first site is home to interesting flora such as *melampyrum nemorosum*, *adonis vernalis*, *scopolia carniolica* and a set of spring orchids (with lady's slipper). This xerothermic meadow offered us interesting sightings, including numerous silver-washed, high brown, queen of Spain and small pearl-bordered fritillaries, marbled white and pearly heath, clouded buff moth, and numerous spiders – wasp spider, venomous *cheiracanthium punctorium*, crab spider (*xysticus lanio*) and (*misunema vatia*). The interesting species of grasshopper, *roeseliana roeselii*, was also spotted there.

On the way to our next site, we visited a breeding colony of bee-eaters, with about 20 birds flying around a sandy slope with nesting holes.

Our next stop, the xerothermic hill, gave us a broad set of interesting blue butterflies: little, short-tailed, silver-studded (Reverdin's), turquoise, Meleager's and chalk-hill, plus three *zygaena* species: *loti*, *minos* and the rarest one – *carniolica*.

**Day 5: Drive to Kacwin, Pieniny Mountains****Thursday 18 July 2019***Weather: sunny & cloudy; 20°C*

After about four hours' drive towards Poland's southern border, we finally reached the Pieniny Mountains, a scenic range formed mostly of limestone rock. Our guesthouse, located in a small village close to the Slovakian border, offered beautiful views over grassy hills and mountains. We didn't stop there for long. To make the most of the weather and daylight, we drove further towards the meadows and hills at the edge of the forest. Here, we observed about 20 white admirals feeding on umbellifers, along with comma butterfly, map, red admiral, dark green fritillary, Essex and large skippers. In one of the muddy puddles we found several yellow-bellied toads and their eggs tied to the plants under water surface. Another interesting sighting was a broad-leaved helleborine orchid found nearby.

**Day 6: Pieniny Mountains****Friday 19 July 2019***Weather: sunny, 20-24°C rain & at the end of the day*

During a short local walk towards the Slovakian border we noticed dipper, common buzzard, honey buzzard, grey wagtail, black redstart and a fox. We next drove to the vast area of raised bog near Tatra Mountains, with characteristic flora – cranberry, Labrador tea, bog bilberry, sundew and white-beak sedge, and interesting butterfly species. While at the bog, we spotted Réal wood white, moorland and pale clouded yellow, cranberry fritillary and silver-studded blue. We also came across a nest of wasps, *polistes dominula*, in heather at the top of a raised bog. In general, the water level in the bog was very low, so most of the orchids had already died, but we managed to see heath-spotted and common spotted orchids still in bloom. Our walk was interrupted by rain, and seeing no chance of the weather improving, we decided to have some relaxing time at our guesthouse.

**Day 7: Pieniny Mountains****Saturday 20 July 2019***Weather: rainy morning, warm & humid afternoon; 25°C*

**Find out more about our Butterflies & Moths of Southern Poland trip or contact us**

01962 302086 sales@wildlifeworldwide.com [www.wildlifeworldwide.com](http://www.wildlifeworldwide.com)

Our plans for today were altered by the rainy morning. Instead of visiting higher parts of the Pieniny Mountains, we decided on a short local walk. There was little chance of seeing butterflies, so we concentrated on birds and foxes in the meadows. When the weather finally improved, we drove towards Three Crowns, the highest peak of Pieniny Mountains, where we took a scenic walk up along one of the gorges, the breeding habitat of Apollo butterfly. In our favour, clouds gave way to sunshine and in such beautiful conditions we spotted some Apollos, swallowtail, short-tailed and silver-studded blues, comma, white admiral, pale clouded and clouded yellows. The walk became even more interesting when we took a closer look at the surrounding plants, including *gentiana cruciata*, *cirsium erisithales*, *delphinium elatum*, *aruncus sylvestris* and *digitalis grandiflora*. On the way back we stopped at the meadow near the village, where the eastern short-tailed blue was spotted. This species probably doesn't breed now in Poland, but we see some of them migrating from Slovakia.

#### **Day 8: Tatra Mountains**

**Sunday 21 July 2019**

*Weather: sunny, +20-14°C & a heavy storm at Kasprowy Wierch summit*

Our plan for today included a visit to the highest part of Carpathians in Poland – the Tatra Mountains. The highlight of the day was a cable-car trip to the top of Kasprowy Wierch (1,987m above sea level) in order to see the alpine flora and fauna. However, the weather was unstable and once we arrived at the top, a heavy thunderstorm forced us to stay at the cable-car station for some time. When the rain finally stopped, we had a walk along the ridge with breathtaking views over the valleys. Weather conditions were still no good for butterflies. Instead we spotted many interesting alpine plants, including *trifolium badium*, *poa alpina* var. *vivipara*, *tofieldia calyculata*, *campanula alpina* and *polymorpha*, *geum reptans*, *asplenium viride*, *sempervivum montanum* and *pseudorchis albida* (small white orchid).

After returning down from the top, we stayed in the area for another walk, this time along the valley of a small alpine stream, where the rare butterfly large ringlet was spotted, as well as a few more interesting plants: *svertia perennis*, *carlina acaulis*, and *orobanche flava*. We barely managed to reach our minibus before the next wave of heavy rain lashed down and accompanied us all the way to our hotel.

#### **Day 9: Transfer to Krakow airport**

**Monday 22 July 2019**

*Weather: sunny; 24°C*

We left our guesthouse just after breakfast and headed back to Kraków. The transfer went smoothly and we arrived early enough to visit the historic centre of the city. After a short orientation walk we agreed it was a good idea if all participants had some free time to explore the Old Town independently. Afterwards we drove to the Balice airport, where our trip ended.
